R3: Need Finding (Design Problem)

This past few weeks the groupwork with Aldwin and Christian Paul has been going smoothly, we brainstorm a lot and we do our requirements all at the same time, we will discuss our plan and schedule on when we are all going to meet and have a group call. we all are communicating and cooperating with one another. The workload is evenly distributed no issues there, and when one of us has finished early we try to help one another. Ask for suggestions on how to improve our areas of work. We take down notes on what needs to be improved upon and before every presentation we meet to make everything smooth and we encourage one another to do their best.

Our topic is on how we can help students manage their assignments and requirements. With this we try to think of what we want as students that can help us be more efficient and punctual with deadlines. In addition, we think of others perspective; our personas perspectives what if we were in their shoes then we thought of features for the application we are making to be more assisting to the user. We are excited on improving our work and come up with the final output.
