## R2 Introduction to Design Thinking Process

When making outputs I just based it on what looks goods and what is pleasing to the eyes. When outputs are asked from me, I take it straight forward and come up with a decent concept and meet the desired expectations of the output. However, now that I'm knowledgeable about this topic I can now think more deeply in creating outputs. With this, I can use to boost my work and how other people's perspective factors in on how your output will perform. Not all individuals will be pleased with your output, understanding that people have different taste and knowing their taste is will be a plus to your output. Moreover, collaborating with others will be improve my creativity and widen my perspectives into certain subjects. Redefining how I see problems and creating solutions for them.
